CLAIMS

1. A fluid dispenser extruded from a low density polyethylene material and moulded under pressure to form a body comprising a bellows closed at one end and including at its other end an upstanding open-ended neck portion formed with external screw threads, the bellows comprising a plurality of vertically spaced ring-shaped outer fold-lines, a plurality of vertically spaced inner ring-shaped fold-lines of smaller diameter than that of the outer fold-lines and each positioned at a height generally midway between each pair of outer fold-lines, and annular webs extending between neighbouring inner and outer fold-lines, and wherein the mean thickness of the webs is between 0.4 and 1.50mm, the height of the dispenser is between 55 and 85mm and the weight of the dispenser is between 10 and 17.5 grams.

2. A dispenser as claimed in claim 1 wherein the mean thickness of the webs is between 0.5 and 1.25mm.

3. A dispenser as claimed in claim 1 or claim 2 wherein the mean thickness at the outer fold-lines is between 0.25 and 0.85mm.

4. A dispenser as claimed in any one of claims 1 to 3 wherein the mean thickness at the inner fold-lines is between 0.70 and 1.50mm.

5. A dispenser as claimed in any one of claims 1 to 4 wherein the ratio of thicknesses of the inner and outer fold-lines falls within the range 1.5:1 and 2.5:1

6. A dispenser as claimed in any one of the preceding claims wherein the upper open end of the neck of the bellows may be closed by a cap formed with internal screw threads.

7. A dispenser as claimed in claim 6 wherein an open-ended narrow-bored tube is provided within the cap to enable flowable material

contained in the bellows to flow to an applicator mounted on or forming part of the cap.

8. A reservoir shaving brush which comprises a dispenser for shaving cream including a bellows for containing a quantity of shaving cream from which is upstanding a neck closed by a cap on which is mounted a brush head comprising a plurality of brush bristles retained within a ferrule by means of an adhesive, an open-ended narrow-bored tube upstanding from the base of a recess formed in the cap and dimensioned to receive the ferrule of the brush head, the tube extending through the ferrule to a height at or just above the upper surface of the ferrule to enable shaving foam to flow from the bellows to the brush bristles when the bellows is depressed by the user.

9. A fluid dispenser comprising a fluid dispenser including a bellows for containing a quantity of fluid to be dispensed from which is upstanding a neck closed by a cap on which is mounted an absorbent pad formed with a dome shaped outer surface, the cap including at least one aperture through which fluid can flow to the pad when the bellows is depressed by the user.
